scrollReveal.js

What is it?

ScrollReveal.js is a JavaScript plugin that let elements animate and reveal once a page loads and is in your viewport. It creates a more dynamic user experience. Anything from a header to an image or even forms can be modified with this plugin. Very similar to the nature of reveal.js, scrollReveal.js presents elements as a visual presentation as opposed to a presentation framework.

Why did I choose it?

I chose this plugin because I liked the way it looked on a website I that stumbled upon earlier in this program. I was curious to see how elements moved and floated so I pulled up the inspect element to look at the code. I initially thought this was something very advanced but I went ahead and looked it up anyway. The only link I had to scrollReveal was the "DIV class data-sr" (the DIV class that was used in html). My curiosity drove me to research the documentation on it. I reviewed the GitHub for it and decided download the plugin just to learn and play around with. To my surprise I found it to be very easy implement and I wanted to share with the class as to how simple this plugin was and how much more it can enhance a page.
